

Smart Librarian

AI RAG-based book recommendations app

that uses ChromaDB for semantic retrieval and a local
tool for summaries.

Main Application Features

Architecture & Core Flow

Extra Features & Safety

Safety layers

Local filtering

Input cleaning and blocked-term lists can stop inappropriate requests before they reach the LLM.

Scope and language handling

The app checks if the request is book-related and adapts behavior for Romanian or English.

OpenAI moderation

Input and output moderation add a remote safety layer on top of the local checks.

Optional capabilities

Bilingual UI

The project supports Romanian and English for both input understanding and response rendering.

Voice and audio

Voice input can be transcribed, and final recommendations can be narrated with TTS.

Image generation

The UI can create a representative cover concept or scene inspired by the recommendation.

End-to-End System Flow

Testing & limitations

A large zipper graphic is centered on the slide. The zipper pull is at the bottom, and the teeth of the zipper extend upwards, splitting the slide into two main sections. The top part of the zipper is a red triangle pointing downwards. The two main sections are dark blue with rounded corners and contain text. The zipper pull is white with a black outline.

What was tested

- ✓ retrieval + tool-calling orchestration
- ✓ guardrails, scope detection, and moderation
- ✓ data loading and title normalization
- ✓ import refresh behavior
- ✓ language, audio, image, and speech helpers

Known limitations

- ✓ recommendation quality depends on catalog quality
- ✓ imported Google Books metadata may be noisy or inconsistent
- ✓ some image requests may still be blocked by safety policies
